SELECTED ENGINEERING WORK · OCTOBER 2026

I build software by making the rules clear first.

I have shipped production work at Programiz Pro and Jobss.ai, led a three-person team through two connected products, and now use a spec-led agent workflow on e-warehouse. I make the product calls, write the specs and review every change.

100,000+
paid learners on the Programiz platform

4 engineers
led at Jobss.ai

400+ PRs
reviewed across two team-built products

Production work

BUILD · LEAD · MAINTAIN

Programiz Pro · ParewaLabs

Oct 2021 to Nov 2023

Coding education platform with more than 100,000 paid learners.

- Built course-flow APIs and the learner dashboard in Node.js, TypeScript and MySQL.
- Built a certificate engine that has issued more than 100,000 verified certificates.
- Integrated Paddle checkout and webhooks. Fixed compiler output arriving in fragments over a socket.
- Added end-to-end tests with Playwright and Cypress in GitHub Actions.

Jobss.ai

Feb 2026 to May 2026

Live job and task marketplace · Software Engineering Intern

- Led four engineers and reviewed every pull request before it merged.
- Built role-based access for four roles against one permission model.
- Built the employer workspace and shared search for employers and job seekers in Laravel and Blade.
- Designed cursor-based feeds and wrote the worker allocation logic.

SYSTEMS WORK

Two products built as one system

Nexus and Aroma · a three-person team I led during my master's · 2024 to 2026

Nexus · warehouse management

Designed around stock and fulfilment problems in my anime-apparel side business.

- PostgreSQL stock ledger uses row locks so two buyers cannot claim the same unit.
- Lot-aware replenishment and return-to-order flows preserve the right inventory state.
- Each retail order moves through its own fulfilment state machine.

Aroma · multi-tenant storefront

Gives independent clothing sellers their own storefront on shared infrastructure.

- Checkout reserves stock on confirmation. Idempotency prevents duplicate orders on retry.
- Payments use a separate service with eSewa and Khalti behind one interface.
- Product details reached a Largest Contentful Paint under two seconds in Lighthouse.

CURRENT WORK · PRE-LAUNCH

e-warehouse

A product for clothing merchants. The first release is an age-aware lot ledger. Each lot records variants, quantities and arrival date, with a market-level date for when it should sell.

What exists now

- The backend skeleton is built. Product features and tests are not in place yet.
- The lot timeline is being worked through in design notes and a spec.

How I build it

- I decide the scope and write the spec.
- An agent implements the planned slice.
- I check the change and its evidence before it lands.

Read the lot timeline design notes

Skills I built for the workflow

Spec-driven development notes

spec-driven	Guides a feature from the first question through the spec, test plan and build order.
design-read	Turns a finished UI design into behaviour notes and a build order.
chifuyu	Checks architecture changes for failure cases and blast radius.
ticket	Writes Gherkin tickets after the scenario and examples are clear.
zippo	Builds e-warehouse backend work and learns only from evidence across separate tasks.

Master of Information Technology and Systems, Software Engineering · VIT Melbourne, 2026
